(54) Title: NOVEL MUSCARINIC ACETYLCHOLINE RECEPTOR ANTAGONISTS

(57) Abstract: Muscarinic Acetylcholine receptor antagonists and methods of using them are provided.

WO 2006/065788 A2

## Novel Muscarinic Acetylcholine Receptor Antagonists

### FIELD OF THE INVENTION

This invention relates to novel derivatives of cyclic amines, pharmaceutical  
5 compositions, processes for their preparation, and use thereof in treating muscarinic  
acetylcholine receptor mediated diseases.

### BACKGROUND OF THE INVENTION

Acetylcholine released from cholinergic neurons in the peripheral and central  
10 nervous systems affects many different biological processes through interaction with two  
major classes of acetylcholine receptors – the nicotinic and the muscarinic acetylcholine  
receptors. Muscarinic acetylcholine receptors (mAChRs) belong to the superfamily of G-  
protein coupled receptors that have seven transmembrane domains. There are five  
subtypes of mAChRs, termed M<sub>1</sub>-M<sub>5</sub>, and each is the product of a distinct gene. Each of  
15 these five subtypes displays unique pharmacological properties. Muscarinic acetylcholine  
receptors are widely distributed in vertebrate organs, and these receptors can mediate  
both inhibitory and excitatory actions. For example, in smooth muscle found in the  
airways, bladder and gastrointestinal tract, M<sub>3</sub> mAChRs mediate contractile responses.  
For review, please see {Brown 1989 247 /id}.

20 Muscarinic acetylcholine receptor dysfunction has been noted in a variety of  
different pathophysiological states. For instance, in asthma and chronic obstructive  
pulmonary disease (COPD), inflammatory conditions lead to loss of inhibitory M<sub>2</sub>  
muscarinic acetylcholine autoreceptor function on parasympathetic nerves supplying the  
pulmonary smooth muscle, causing increased acetylcholine release following vagal nerve  
25 stimulation. This mAChR dysfunction results in airway hyperreactivity mediated by  
increased stimulation of M<sub>3</sub> mAChRs{Costello, Evans, et al. 1999 72 /id}{Minette,  
Lammers, et al. 1989 248 /id}. Similarly, inflammation of the gastrointestinal tract in  
inflammatory bowel disease (IBD) results in M<sub>3</sub> mAChR-mediated hypermotility {Oprins,  
Meijer, et al. 2000 245 /id}. Incontinence due to bladder hypercontractility has also been  
30 demonstrated to be mediated through increased stimulation of M<sub>3</sub> mAChRs {Hegde &  
Eglen 1999 251 /id}. Thus the identification of subtype-selective mAChR antagonists  
may be useful as therapeutics in these mAChR-mediated diseases.

Despite the large body of evidence supporting the use of anti-muscarinic receptor therapy for treatment of a variety of disease states, relatively few anti-muscarinic compounds are in use in the clinic. Thus, there remains a need for novel compounds that are capable of causing blockade at M<sub>3</sub> mAChRs. Conditions associated with an increase  
 5 in stimulation of M<sub>3</sub> mAChRs, such as asthma, COPD, IBD and urinary incontinence would benefit by compounds that are inhibitors of mAChR binding.

### **Methods of Preparation**

#### **Preparation**

The compounds of Formula (I) may be obtained by applying synthetic procedures, some of which are illustrated in the Schemes below. The synthesis provided for these Schemes

is applicable for producing compounds of Formula (I) having a variety of different R1, R3, R4, R5 and R6, which are reacted, employing substituents which are suitable protected, to achieve compatibility with the reactions outlined herein. Subsequent deprotection, in those cases, then affords compounds of the nature generally disclosed. While some Schemes are shown with specific compounds, this is merely for illustration purpose only.

### Preparation 1

Compounds of formula **8** can be prepared according to the general schemes (1, 2 and 3) depicted below. Scheme 1 showed the solid phase synthesis. 2-Amino-5-methylthiazole was treated with sodium bromide and dichloroacetone to provide 6-(chloromethyl)-2-methylimidazo[2,1-*b*][1,3]thiazole **1**, which was reacted with sodium azide to form 6-(azidomethyl)-2-methylimidazo[2,1-*b*][1,3]thiazole **2**. The azide **2** was converted to amine **3** by hydrogenation via 10% palladium on carbon. Resin-bound amine **4** was prepared by reductive amination of 2,6-dimethoxy-4-polystyrenebenzyloxy-benzaldehyde (DMHB resin) with amine **3**. Reaction of **4** with Fmoc-protected amino acid, followed by removal of the protecting group, provided resin-bound intermediate **6**. The amines were coupled with resin-bound intermediate **6** to afford the corresponding resin-bound ureas **7**. The resin was then cleaved by 50% trifluoroacetic acid in dichloromethane to afford targeted compounds **8** (Scheme 1).

25 atmosphere of H<sub>2</sub> overnight. Methyl 5-amino-2-thiophenecarboxylate (1.67 g, 92%) was obtained after filtration and concentration.

LCMS (ESI) 157 [M+H]<sup>+</sup>.

To a mixture of 350 mg (2.23 mmol) methyl 5-amino-2-thiophenecarboxylate in 10 mL of anhydrous dichloromethane was added 448 mg (2.23 mmol) 4-  
30 nitrobenzylchloroformate. The reaction mixture was stirred at room temperature for half an hour and concentrated. Diisopropylethylamine (1.09 mL, 6.22 mmol), DMHB resin bound *N*-[(2-methylimidazo[2,1-*b*][1,3]thiazol-6-yl)methyl]-L-tyrosinamide (300 mg, 0.24 mmol) **6** and dimethyl formamide (10 mL) were added to reaction mixture and shaken overnight. The resin was washed with CH<sub>2</sub>Cl<sub>2</sub> (3 x 10 mL), CH<sub>2</sub>Cl<sub>2</sub>/MeOH (1:1, 3 x 10

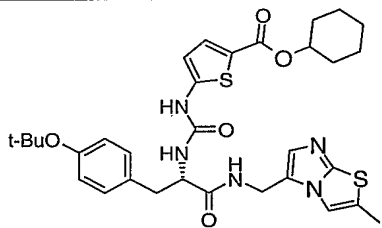

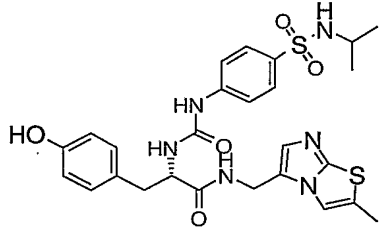

mL), MeOH (3 x 10 mL) and CH<sub>2</sub>Cl<sub>2</sub> (3 x 10mL). The resulting resin was dried in vacuum oven at 35 °C for 24 h.

The dry resin was treated with 2 mL of 50% trifluoroacetic acid in dichloromethane at rt for 2h. After the cleavage solution was collected, the resin was treated with another 2 mL of 50% trifluoroacetic acid in dichloromethane at rt for 10min. The combined cleavage solutions were concentrated *in vacuo*. The residue was purified using a Gilson semi-preparative HPLC system with a YMC ODS-A (C-18) column 50 mm by 20 mm ID, eluting with 10% B to 90% B in 3.2 min, hold for 1 min where A = H<sub>2</sub>O (0.1% trifluoroacetic acid) and B = CH<sub>3</sub>CN (0.1% trifluoroacetic acid) pumped at 25 mL/min, to produce methyl 5-(((1*S*)-1-[(4-hydroxyphenyl)methyl]-2-[[[(2-methylimidazo[2,1-*b*][1,3]thiazol-5-yl)methyl]amino]-2-oxoethyl)amino]carbonyl]amino)-2-thiophene carboxylate (white powder, 7 mg, 5.7% over 5 steps).

## **BIOLOGICAL EXAMPLES**

The inhibitory effects of compounds at the M<sub>3</sub> mAChR of the present invention are determined by the following *in vitro* and *in vivo* assays:

5

### **Analysis of Inhibition of Receptor Activation by Calcium Mobilization:**

#### **1) 384-well FLIPR assay**

A CHO (chinese hamster ovary) cell line stably expressing the human M<sub>3</sub> muscarinic acetylcholine receptor is grown in DMEM plus 10% FBS, 2 mM Glutamine and 200 ug/ml G418. Cells are detached for maintenance and for plating in preparation for assays using either enzymatic or ion chelation methods. The day before the FLIPR (fluorometric imaging plate reader) assay, cells are detached, resuspended, counted, and plated to give 20,000 cells per 384 well in a 50 ul volume. The assay plates are black clear bottom plates, Becton Dickinson catalog number 35 3962. After overnight incubation of plated cells at 37 degrees C in a tissue culture incubator, the assay is run the next day. To run the assay, media are aspirated, and cells are washed with 1x assay buffer (145mM NaCl, 2.5mM KCl, 10mM glucose, 10mM HEPES, 1.2 mM MgCl<sub>2</sub>, 2.5mM CaCl<sub>2</sub>, 2.5mM probenecid (pH 7.4.) Cells are then incubated with 50ul of Fluo-3 dye (4uM in assay buffer) for 60 – 90 minutes at 37 degrees C. The calcium- sensitive dye allows cells to exhibit an increase in fluorescence upon response to ligand via release of calcium from intracellular calcium stores. Cells are washed with assay buffer, and then resuspended in 50ul assay buffer prior to use for experiments. Test compounds and antagonists are added in 25 ul volume, and plates are incubated at 37 degrees C for 5 -30 minutes. A second addition is then made to each well, this time with the agonist challenge, acetylcholine. It is added in 25 ul volume on the FLIPR instrument. Calcium responses are measured by changes in fluorescent units. To measure the activity of inhibitors / antagonists, acetylcholine ligand is added at an EC<sub>80</sub> concentration, and the antagonist IC<sub>50</sub> can then be determined using dose response dilution curves. The control antagonist used with M<sub>3</sub> is atropine.

#### **2) 96-well FLIPR assay**

Stimulation of mAChRs expressed on CHO cells were analyzed by monitoring receptor-activated calcium mobilization as previously described . CHO cells stably expressing M<sub>3</sub> mAChRs were plated in 96 well black wall/clear bottom plates. After 18 to 24 hours, media was aspirated and replaced with 100 µl of load media (EMEM with Earl's salts,

35

0.1% RIA-grade BSA (Sigma, St. Louis MO), and 4  $\mu$ M Fluo-3-acetoxymethyl ester fluorescent indicator dye (Fluo-3 AM, Molecular Probes, Eugene, OR) and incubated 1 hr at 37° C. The dye-containing media was then aspirated, replaced with fresh media (without Fluo-3 AM), and cells were incubated for 10 minutes at 37° C. Cells were then washed 3 times and incubated for 10 minutes at 37° C in 100  $\mu$ l of assay buffer (0.1% gelatin (Sigma), 120 mM NaCl, 4.6 mM KCl, 1 mM  $\text{KH}_2\text{PO}_4$ , 25 mM  $\text{NaHCO}_3$ , 1.0 mM  $\text{CaCl}_2$ , 1.1 mM  $\text{MgCl}_2$ , 11 mM glucose, 20mM HEPES (pH 7.4)). 50  $\mu$ l of compound ( $1 \times 10^{-11}$  –  $1 \times 10^{-5}$  M final in the assay) was added and the plates were incubated for 10 min. at 37° C. Plates were then placed into a fluorescent light intensity plate reader (FLIPR, Molecular Probes) where the dye loaded cells were exposed to excitation light (488 nm) from a 6 watt argon laser. Cells were activated by adding 50  $\mu$ l of acetylcholine (0.1-10 nM final), prepared in buffer containing 0.1% BSA, at a rate of 50  $\mu$ l/sec. Calcium mobilization, monitored as change in cytosolic calcium concentration, was measured as change in 566 nm emission intensity. The change in emission intensity is directly related to cytosolic calcium levels. The emitted fluorescence from all 96 wells is measured simultaneously using a cooled CCD camera. Data points are collected every second. This data was then plotting and analyzed using GraphPad PRISM software.

#### **Methacholine-induced bronchoconstriction**

Airway responsiveness to methacholine was determined in awake, unrestrained BalbC mice ( $n = 6$  each group). Barometric plethysmography was used to measure enhanced pause (Penh), a unitless measure that has been shown to correlate with the changes in airway resistance that occur during bronchial challenge with methacholine. Mice were pretreated with 50  $\mu$ l of compound (0.003-10  $\mu$ g/mouse) in 50  $\mu$ l of vehicle (10% DMSO) intranasally, and were then placed in the plethysmography chamber. Once in the chamber, the mice were allowed to equilibrate for 10 min before taking a baseline Penh measurement for 5 minutes. Mice were then challenged with an aerosol of methacholine (10 mg/ml) for 2 minutes. Penh was recorded continuously for 7 min starting at the inception of the methacholine aerosol, and continuing for 5 minutes afterward. Data for each mouse were analyzed and plotted by using GraphPad PRISM software.
